PROJECT GALILEO

SOFTWARE INTERFACE SPECIFICATION

S/C Event File (SEF)

SIS #211-05 P2

June 07, 1994

ABSTRACT: This SIS describes the form and syntax of each S/C Event File (SEF) which is a product of the Mission Sequence System (MSS). Each SEF will contain a header that identifies and describes the scope of the file, plus a body which provides a time ordered list of events occuring in a particular sequence.

CHANGE CONTROL: The Galileo change control procedures specified in STAP 2.17 apply to this document.

Jet Propulsion Laboratory
California Institute of Technology

JPL D-296

DOCUMENT CHANGE LOG

Change	Date	Affected Portions
Original	07/24/81	All
Change 1	05/17/83	Indicated by change bars
Original Phase 2 Build C	2/5/85	All
Change 1	07/10/85	Indicated by change bars per SCR 749
Change 2	02/19/86	Indicated by change bars per SCR 693
Change 3	09/10/86	Indicated by change bars per SCR 919
Change 4	06/03/87	Indicated by change bars per SCR A298
Change 5	09/01/88	Indicated by change bars per SCRs 715A,881, A361 and A583

SECTION 1

GENERAL DESCRIPTION

1.1 CONTENT OVERVIEW

This Software Interface Specification (SIS) provides a people-oriented form and syntax for displaying sequence data within the Mission Operation System (MOS) environment. The header section identifies the type of file, its creation date, scope and genealogical ancestry. The body section lists sequence components, special subsystem status summaries and other events.

1.2 SCOPE

The format and syntax specifications in this document apply to all phases of the Galileo Mission.

1.3 APPLICABLE DOCUMENTS

625-640-211031	SEQGEN SRD
625-645-211031	SEQuence GENeration User's Guide

UP 8478 Sperry Univac 1100 Series Processor Common Input/Output System (PCIOS), Section 5.2, System Data Format

1.4 SUBSYSTEM SITING

1.4.1 Interface Location, Medium

This interface shall be implemented in an ASCII element of a program file in Univac Standard Data File Format (SDFF). It will be in human-readable form and printouts will be generated.

1.4.2 Data Source, Destinations and Transfer Method

The S/C Event File (SEF) is generated by the CHECKER processor of the SEQGEN Program. It is read by the MCHS-SETUP Program (in SEQTRAN) which generates "PREDICTS" for sequences simulated in the MCHS. It is also read by SEG in order to create a Sequence Of Events (SOE). SNIP reads the SEF to obtain SSI shutter time and PWS event time, NIMS OBSTAB reads the SEF to obtain NIMS events, and, SNIP, OBSTAB and DMT AQQC all read the SEF for playback process predicts. C-KERNEL reads SCANOPS Predicts file. The SEF is read by E-Kernel generation software (name TBD), which is operated by GLL SDT.

1.4.3 Pertinent Relationships with Other Interfaces

N/A

1.4.4 Labeling and Identification (Internal/External)

The original file name will be written into the header in the form:

Qualifier*File.Element/Version

SECTION 2

INTERFACE CHARACTERISTICS

2.1 HARDWARE CHARACTERISTICS

2.1.1 Special Equipment and Device Interfaces

None.

2.1.2 Special Setup Requirements

None.

2.2 VOLUME AND SIZE

Each SEF shall be limited to 10000 parameter sets. A parameter set contains all the data necessary to invoke a given sequence component.

Parameter sets shall conform to the requirements of the Standard Sequence Data File, see SIS 211-13.

There shall be no more than 15 EPOCH header records (see 4.2-1).

2.3 INTERFACE MEDIUM CHARACTERISTICS

The file shall be written in Univac Standard Data File Format (SDFF). This is the format described in the Univac Executive manual and used by Univac Fortran V, Athena Fortran and LIB*CLIB$ routines ELT READ and ELT WRITE. It is <u>not</u> the format described in the Univac PCIOS manual and used by Univac FTN and PL/1.

2.4 FAILURE PROTECTION, DETECTION AND RECOVERY FEATURES

2.4.1 File Backup Requirements

This is handled by the individual software systems, e.g. the MSS ARCHIVE subsystem.

2.4.2 Security/Integrity Measures

These files have no inherent security because they are directly text editable using system routines.

2.5 END-OF-FILE (OR MEDIUM) CONVENTIONS

End-of-File conventions shall be in accordance with Univac Standard Data File Format (SDFF).

SECTION 3

ACCESS

3.1 PROGRAMS USING THE INTERFACE

It is required for SEQTRAN, SCANOPS and SEG to access this file.

3.2 SYNCHRONIZATION CONSIDERATIONS

3.2.1 Timing and Sequencing Characteristics.

There shall be a BEGIN and a CUTOFF time in the header section. Each event in the body of the file shall have a time which falls in between BEGIN and CUTOFF.

In this document "time" refers to Spacecraft Event Time, which is Universal Time (UT, also referred to as GMT) of execution on the spacecraft bus. Unless otherwise specified, "time" is expressed in the form "yy-ddd/hh:mm:ss.fff, i.e. years, days of year, hours, minutes, seconds and fractions of a second.

Within the body of the file the events shall be arranged in time order.

3.2.2 Effective Duration

The effective duration is the difference between the BEGIN and the CUTOFF times of the header section.

3.2.3 Priority Interrupts

N/A

3.3 INPUT/OUTPUT PROTOCOLS, CALLING SEQUENCES

N/A

SECTION 4

DETAILED INTERFACE SPECIFICATIONS

4.1 STRUCTURE AND ORGANIZATION OVERVIEW

The SEF file shall consist of an ASCII element of a program file. There will be exactly one file per element. The element shall consist of 132- character images. The file shall be organized into a header section and a body section as follows:

		Keyword	Data Content
	#	$$GLL	SPACECRAFT EVENT FILE
	#	*<Acronym>	<Qual*File.Element/Version>
	#	*LEVEL	<Level>
	#	*PREP	<Preparer's name and extension>
	#	*RUNID	<Run ID of job generating file>
	#	*PROGRAM	<Program name and version>
	#	*CREATION	<Time the file was created>
	#	*BEGIN	<Begin time of sequence>
	#	*EPOCH	<EPOCH name>, <EPOCH time>
	#	.	
	#	.	
	#	.	
Header	#	*CUTOFF	<Cutoff time of sequence>
Section	#	*TITLE	<Title of sequence>
	#	*<Acronym>	<Q*F.E/V of file used by program
	#		generating this file>
	#	*<Acronym>	<Q*F.E/V of ancestor file not
	#		directly used by program
	#		using this file>
	#	.	
	#	.	
	#	.	
	#	$$EOH	
	#	Combinations of:	
	#	Sequence Components	
Body	#	Subsystem Status Summaries	
Section	#	Other events	
	#	.	

The Header Data content begins in column 13.

4.2 SUBSTRUCTURE DEFINITION AND FORMAT

4.2.1 Header

The descriptive name on the $$GLL record shall be "S/C EVENT FILE".

The remainder of the header shall conform to the Standard Sequence Data File conventions specified in section 4.2.1 of SIS 211-13.

4.2.2 Body

The body of the SEF file shall consist of event lines and continuation lines of up to 132 characters in length.

Event lines shall have a full Spacecraft CLocK (SCLK) time in decimal, followed by SpaceCraft Event Time (SCET), followed by event content in the following format:

Columns	Content
1 - 8	Major frame count
9	":"
10, 11	Minor frame count
12	":"
13	Real Time Interrupt (RTI)
14	Blank
15, 16	Year
17	"-"
18-20	Day of year
21	"/"

22-33	hh:mm:ss.fff (hours, minutes, seconds and fractions of seconds)
34	Blank
35-131 +	Event content

Continuations:

Continuation lines shall have columns 1 - 34 blank. Any number of continuation lines may follow an event line.

Event content starting in column 35, shall consist of one of the following:

a) A verbatim copy of a parameter set (see 211-13), followed by
' << ' title-of-parameter-set ' >> ', optionally followed by state-change-list, ';' .

There are always two semicolons: one at the end of the parameter set and one after everything else. The state-change-list is made up of state-changes separated by commas. A state-change is free form, except that it may not contain a comma or semi-colon.

State-changes are generated by SEQGEN Event Logic when some parameter set causes the value of a node having an SEF trigger to change value.

b) A Status-Event, consisting of a status-event-name ':', followed by a status-item-list ';' .

The status-item-list is made up of status-items, separated by commas. A status-item can be defined to have both fixed and variable content. An '*' before one of the variable parts shall indicate that it is a changed value.

The status-events that appear in the SEF shall be defined in this SIS document. In these definitions undefined columns shall be blank and strings shall be left justified.

As a rule, all status-events will appear at the start and end of the SEF, and when some value in a status-event changes.

c) A Comment, consisting of a ';' in column 35, followed by free form text.

d) A Status-Comment, consisting of ';' '<' state-description '>', followed in column 70 by the command that produces that state.

These commands can be continued in column 70 of a continuation line, but shall not exceed 80 characters in length or 20 fields, including the five standard parameters (Level, Name, ID, Prcsr, Time).

Status-comments are generated by SEQGEN (CHECKER) at the BEGIN and CUTOFF times of the sequence, and as instructed by the use of the SEQGEN *SCSTATE,E instruction. The selection of status-comments to be generated is specified in the S/C Status Criteria File (SCSC). See SEQGEN User's Guide section 4.2.

4.2.2.1 DMS Status Event. This event shall be generated each start and finish of a runup, rundown or reversal and any other 6DMSC/6DMSR commands.

Columns	Content
1-34	Times, see 4.2.2
35-38	"DMS:" Status Event Name
40	"*" if following is a change since last report
41-48	Choice of: "RUNUP," "RECORD," "RUNDOWN," "READY," "REWIND," "PLAYBACK," "SLEW," “SLEW-TIC,” “REVERSE,” “AUTOSTOP,” “RUNNING,” ”RESUME,”
51-54	Choice of: "RDY," "P7," "R7," "R28," "R115," "R403," "R806," "S7," "S28," "S115," "S403," "S806,"
57-61	"TRACK"
63	"*" if following is a change since last report
64	Choice of "0" "1" "2" "3" "4"
65	","
67	"*" if following is a change since last report

68-70	"FWD," or "REV,"
73-75	"TIC"
77	"*" if following is a change since last report
78-84	Tape Increment Count (TIC) in the format of NNNN.NN
86-88	"+/-"
91-96	Uncertainty TICs in the format of NNN.NN
97	";"

The DMS continuation line will show if there is any change in the DMS status event:

Continuation Line:

35-43	“DMS USED:”
45-52	Start stop cycles, real number with 1 decimal place (Format NNNNNN.N)
54-71	“START STOP CYCLES,”
73-76	Tape passes, integer (up to 4 digits)
78-89	“TAPE PASSES,”
91-97	Tracks of tape across the heads, real number with 2 decimal places (Format NNNN.NN)
99-129	“TRACKS OF TAPE ACROSS THE HEADS”
130	‘,’

Continuation Line:

35-40	Negator spring cycles, real number with 1 decimal place (Format NNNN.N)
42-62	“NEGATOR SPRING CYCLES”
63	“;”

4.2.2.2 TVSHUT Status Event. This event shall be in Post Expansion checks each time a shutter opens or for a 36IP command with an exposure of 29.

Columns	Content
1-34	Times, see 4.2.2
35-41	"TVSHUT:" Status Event Name
43-46	"FILT"

62-64	Choice of “ENA” “DIS”
65	“;”

4.2.2.3 SSIMODE Status Event. This event shall be generated for each 36IM command. Note: The last field RFMT (RECORD FORMAT) in the SSI Mode Status Event is derived from 3 params (The Imaging Rate, OP mode and Compressor Mode) of the 36IM CMD. If the 3 params are not coherent, the RFMT will show a “???”.

Columns	Content

4.2.2.8 BITS STATUS EVENT. This event provides the number of bits that were packetized during the past interval. The interval is user specified. By default, it is an 12 hour interval. (Please refer to *PBTINT Instruction in the SEQGEN User's Guide.)

Interval measurements will be in integer bits. Cumulative measurements will be reset at low rate playback initiation and termination. Cumulative values will be expressed as megabit floating point numbers with six digits to the right of the decimal point.

The BITS status event will be printed before and after low rate playback is initiated and terminated, and at the end of each incremental interval from such juncture.

4.2.2.14 INST_RT_DATA EVENT. This event shall accompany each BITS EVENT (See 4.2.2.8). It presents cumulative values of bits packetized for each instrument or engineering source.

Cumulative values will be reset at low rate playback initiation and termination. Cumulative values will be expressed as megabit floating point numbers with six digits to the right of the decimal point.

The INST_RT_DATA status event will be printed before and after low rate playback is initiated and terminated, and at the end of each incremental interval from such juncture.

4.2.2.15 INST_PB_DATA EVENT per ECR 35566, Table 4.3.2. This event presents cumulative values of bits packetized for each kind of instrument or engineering data that can be selected in a playback table (PBT).

Cumulative values will be reset at low rate playback initiation and termination. Cumulative values will be expressed as megabit floating point numbers with six digits to the right of the decimal point.

The INST_PB_DATA status event will be printed after low rate playback is initiated, before it is terminated, and any time the ACT_NAME in an expiring RECREC ECMD is about to be replaced by an new ACT_NAME in the next RECREC.

The cumulative data values will be zero in the first INST_PB_DATA event after playback initialization. They will contain the accumulations from initialization through the end of the named ACT_NAME, or for the entire playback at playback termination.

Columns	Content
1-34	Times, see 4.2.2
